

## Seawater Intrusion Groundwater Monitoring

Coastal groundwater basins (freshwater supplies in the ground) can be vulnerable to seawater intrusion, which may jeopardize water quality. Seawater could enter the Montecito Groundwater Basin in a number of ways and compromise this important water supply. To provide for early detection and prevention of potential seawater intrusion, Montecito Groundwater Sustainability Agency is establishing a network of groundwater monitoring wells which will regularly supply important data. Consistent data collection and analysis is key for long-term sustainability of the community's groundwater supply.
